Introduction

This is the NETLAB+ Automated Backups Guide, for the virtual edition of NETLAB+.

NETLAB+ is a remote access solution that allows academic institutions to deliver a hands-on IT training experience with a wide variety of curriculum content options. The training environment that NETLAB+ provides enables learners to schedule and complete lab exercises for information technology courses. NETLAB+ is a versatile solution for facilitating IT training in a variety of disciplines including networking, virtualization, storage and cyber security.

It is imperative that you establish a plan for making backups of your NETLAB+ virtual appliance on a regular basis to protect against data loss and disaster recovery preparedness. You are also strongly advised to perform a backup before any software update and prior to adding additional content to your NETLAB+ system.

It is the responsibility of the customer to maintain backups of their NETLAB+ VE system.

To ensure that backups are performed regularly, consider implementing an automated method of creating backups. Taking the time to set up a robust, automated backup process helps protect the investment your organization has made in your NETLAB+ VE system. The material in this guide provides guidance on implementing automated backups of your NETLAB+ VE system, using VMware vSphere Data Protection (VDP).

1 Prerequisites

This section will help outline what is required before configuring a backup job.

1.1 **Pre-installation Configuration**

Mechanisms that need to be in place, before the *vSphere Data Protection* (*VDP*) installation:

- **vCenter Licensing:** The *vCenter* needs to be licensed prior to deploying the *vSphere Data Protection* appliance.
- **DNS Configuration**: A *DNS* server must be in place to support both forward and reverse lookup on the *VDP* and the *vCenter*.
- NTP Configuration: The VDP appliance receives the correct time through vSphere, so NTP must be configured properly on all vSphere Hosts and vCenter Servers.

2 Implementing Automated Backups

This section assumes that a working infrastructure is already in place. The *NETLAB+ VE* system should already be configured to match the infrastructure and vice versa.

The proposed automated backup solution requires the use of *vSphere Data Protection*. This is a backup and recovery solution from *VMware*. It has been configured to be fully integrated with existing *VMware vCenter Server* appliances and *VMware vSphere Web Client*. This backup solution has the ability to provide disk-based backups of virtual machines as well as applications.

More features of the *VDP* appliance can be found in the <u>VMware vSphere Data</u> <u>Protection Technical Overview</u> guide.

2.1 Acquiring the vSphere Data Protection OVA

The *vSphere Data Protection* OVA is required to install the *VDP* application in a given *VMware Infrastructure*. This section will describe how to download the *VDP* appliance from VMware.

- Using a web browser, preferably on an administrative machine, navigate to <u>http://my.vmware.com/en/web/vmware/downloads</u>. This will bring you to the *All Downloads* page supported by *VMware*. Login to *My VMware*.
- 2. Underneath *Datacenter & Cloud Infrastructure*, click on **Download Product** for the *VMware vSphere* product.

Datacenter & Cloud Infrastructure

VMware vCloud Suite	Download Product Drivers & Tools			
VMware vSphere with Operations Management	Download Product Drivers & Tools Get Training			
VMware vSphere	Download Product Drivers & Tools I Download Trial I Get Training			
VMware vSAN	Download Product Drivers & Tools Download Trial Get Training			
VMware vSphere Data Protection Advanced	Download Product Drivers & Tools Get Training			
VMware vSphere Storage Appliance	Download Product Drivers & Tools			
VMware vSphere Hypervisor (ESXi)	Download Product Drivers & Tools Get Training			
VMware vCloud Director	Download Product Drivers & Tools Get Training			

3. On the *Download VMware vSphere* page, scroll down and determine the type of licensing used for your *VMware vSphere*. Once identified, click on the **Go to Downloads** link for the *VMware vSphere Data Protection 6.x.x* product.

4. On the *Download VMware vSphere Data Protection 6.x.x* page, click on the **Download Now** button for *VMware vSphere Data Protection*.

If not logged in already, the webpage will prompt for a login. Continue with the login.

- 5. The download should begin, if it does not, proceed to the next step.
- 6. If a message appears stating that you do not have permissions to download the product, click on the **Download Trial** link exposed below the message.

 The page will redirect to a page called *Product Evaluation Center for VMware* vSphere and vSphere with Operations Management. Scroll down towards the Download Packages table and expand Download additional components (optional).

Download Packages

Ð	Download the hypervisor (vSphere ESXi Installable)
+	Download VMware vCenter Server - Choose only one of the options based on which type of vCenter you want to run.
Đ	Download VMware vRealize Operations and vRealize Log Insight
ŧ	Download additional components (optional)

(¹)Click for information about using MD5 checksums, SHA-1 checksums and SHA-256 checksums.

8. Once the list is expanded, click on the **Manually Download** button for *VMware vSphere Data Protection*.

9. The download should now begin.

2.2 Deploying vSphere Data Protection

This section describes how to deploy the *VDP* appliance from an *OVA* file.

For additional guidance on deploying *VDP*, reference to pages **29-30**, from the <u>*VMware*</u> *vSphere Data Protection Administration Guide*.

1. Navigate to the VMware Web Client and login as administrator.

vm ware [,]		
User name: Password:	administrator@vsphere.local 	VMware vCenter Single Sign-On

Before proceeding any further, verify that VMware Client Integration Plug-in is installed and running on the web browser being used for the Web Client. It can be confirmed if the plugin is installed by seeing whether or not the "Download Client Integration Plugin" message appears on the bottom of the Web Client login screen. If present, the plugin is not installed.

2. Once logged in, on the *Home* tab, click on the **Hosts and Clusters** icon.

Home						
Inventories						
2		Ð				
vCenter Inventory Lists	Hosts and Clusters	VMs and Templates				

3. In the *Navigator* pane, right-click on the desired **ESXi host** and select **Deploy OVF Template**.

4. Once the *Deploy OVF Template* wizard appears, notice that a *Client Integration Access Control* window may appear. Click **Allow** (or anything similar - browser dependent) to initiate access for the plugin utility.

Client Integration Access Control
This site is using VMware Client Integration Plug-In. Do you want to allow it to access your operating system?
Protocol: https
Hostname: 172.16.1.1
Port: 9443
Allow Deny (automatic in 290 seconds)
✓ Always ask before allowing this site
The VMware Client Integration Plug-In will give web applications and remote VMs access to your operating system. Only allow sites you trust.

5. In the *Deploy OVF Template* window, in the *Select source* page, choose either **URL** or **Local file**, depending on where the *vSphereDataProtection-x.x.ova* file is stored. For this example, the OVA is stored locally on the client machine. Click **Next**.

Deploy OVF Template		(?) }		
1 Source	Select source Select the source location

13. Monitor the deployment progress in the *Recent Tasks* pane. Once finished, rightclick on the **vSphere Data Protection** VM in the *Navigator* pane and select **Open Console**.

14. Verify that the *vSphere Data Protection* VM has finished its boot-up process before proceeding to the next step. A blue welcome screen will signal that the boot-up is complete.

2.3 Configuring vSphere Data Protection

This section will provide guidance on how to configure the *VDP* appliance so that it can be added to *vCenter*.

For additional guidance on deploying *VDP*, reference to pages **30-32**, from the <u>VMware</u> <u>vSphere Data Protection Administration Guide</u>.

 Using the client machine, open a **new tab** in the web browser and enter https://YOUR_VDP_IP:8543/vdp-configure into the address field and press the Enter key.

IP addresses will vary, depending on the infrastructure.

- 2. Once the web page redirects, notice an SSL certificate warning may appear. Depending on the web browser, proceed to the destination, ignoring the warnings.
- 3. On the *vSphere Protection Configuration Utility* login page, login using the default credentials; **root** as the *username* and **changeme** as the default *password*.

vm ware [.]		
		vSphere Data Protection Configuration Utility

It is important to have *DNS* configured prior to initial *VDP* setup. A reverse *DNS* lookup (*PTR* record) needs to be configured on the local DNS, otherwise an error message will appear (see below):

For more information on *DNS* configuration, see **page 23**, *DNS Configuration*, in the following *VMware* guide: <u>vSphere Data Protection Administration Guide</u>.

6. On the *Time Zone* page, choose your local time zone and click **Next**.

7. On the VDP Credentials page, enter a new password for the vSphere Data Protection appliance. Click **Next**.

Welcome	VDP Credentials
Network Settings	Enter a password for the VDP Appliance.

14. On the *Ready to Complete* page, if desired, check the box for **Run performance analysis on storage configuration** and **Restart the appliance if successful** to test storage performance compatibility. Click **Next** to continue.

15. Once the storage check finalizes without any errors, the appliance will restart. Wait until the appliance fully reboots to access it again.

For additional guidance on minimum storage performance benchmarks, reference to page **71**, from the <u>VMware vSphere Data Protection Administration Guide</u>.

2.4 Configuring Backup Window on vSphere Data Protection

This section will cover how to change the amount of time available for processing backup requests.

For additional guidance on editing the backup window, reference to pages **54-55**, from the <u>VMware vSphere Data Protection Administration Guide</u>.

1. To access the *VDP* appliance, log into the *vCenter* using the *Web Client*. On the **Home** tab, notice a **VDP** icon is present. Click on the icon to access the VDP control interface.

Navigator	Ŧ	🚹 Home							
🖣 History)	Home

2.6 Restoring a Backup

This section will help guide through the steps on how to restore a *NETLAB+ VE* backup created from a backup job.

After restoring a backup of NETLAB+ VE, it will be necessary to reactivate your NETLAB+ VE system by entering your license key. After completing the steps below, see the *Manage License* section of the *NETLAB+ VE Administrator Guide* for details.

For additional guidance on restoring a backup, reference to pages **130-135**, from the <u>VMware vSphere Data Protection Administration Guide</u>.

1. To restore a virtual machine from a backup job, navigate to **Hosts and Clusters** from the *Navigator* pane.

2. Expand the list in the *Navigator* pane and right-click on the **NETLAB+ VE** virtual machine, selecting **All VDP Actions > Restore Rehearsal**.

3. Notice a *Restore image backup using VDP* wizard appears. On the *Select Backup* page, choose **any desired backup** that you wish to restore from and click **Next**.

Choosing these settings will restore and replace the current NETLAB+ VE virtual machine that is in production. Because of this, click **Cancel** and make sure to **power off** the **NETLAB+ VE** virtual machine. If it is not powered off, the restore request will result in an error stating that it cannot be fulfilled due to the VM being powered on.

5. On the *Ready to Complete* page, review the restore request and click **Finish**.

Restore image backup using VDP-1	8
 1 Select Backup 2 Set Restore Options 3 Ready to Complete 	Ready to Complete Review the following restore requests and click either Finish to accept the requests, or Back to go to the appropriate page to make changes.
	The restore parameters entered will result in the following virtual machines being overwritten: - NETLAB_VE(Virtual machine configuration will be replaced.) Virtual Machines: 1 virtual machine will be restored.
a martine	 O new virtual machines will be created. 1 virtual machine will be replaced.
	Back Next Finish Cancel

- 6. Once the restore request initiates, notice the progress in the *Recent Tasks* pane to completion.
- 7. It will be necessary to reactivate your NETLAB+ VE system by entering your license key. Please refer to the *Manage License* section of the *NETLAB+ VE Administrator Guide* for details.

3 Additional Configuration Best Practices

This section will provide links to the *vSphere Data Protection Administration Guide* for best practices on optional configurations for the *VDP* appliance. These are not required to run backups but may prove useful to the administrator.

3.1 Configuring the Email Notifications and Reports

For guidance on configuring email notifications and reporting, reference to pages **55-56**, from the <u>VMware vSphere Data Protection Administration Guide</u>.

4 **Common Alarms**

This section will provide tips on fixing common alarms that may surface when initially deploying the *VDP* appliance.

For identifying alarm definitions pertinent to the *VDP* appliance, reference to page **59**, from the <u>VMware vSphere Data Protection Administration Guide</u>.

4.1 Maintenance Services are not Running

If a "VDP: Maintenance services are not working" alarm appears, the steps outlined below will help manually start the maintenance services on the VDP appliance.

- 1. Either **SSH** or **directly console** into the *vSphere Data Protection* system.
- 2. Once direct access is initiated, log into the system using **root** as the *username* and the password in which was configured on the system.
- 3. Using the shell, enter the command below to view the status of the maintenance windows scheduler.

dpnctl status

4. Start the maintenance windows by entering the command below.

dpnctl start maint

5. Confirm the status of the maintenance windows scheduler to make sure it is now enabled. Enter the command below.

dpnctl status
